P. A. M. Dirac. Die Prinzipien der Quantenmechanik. (German) [The Principles of Quantum Mechanics]. Verlag von S. Hirzel, Leipzig, Germany, 1930. xi + 274 pp. LCCN ???? Translated by Werner Bloch from the English original.

[Dir30f] P. A. M. Dirac. *The Principles of Quantum Mechanics*. International series of monographs on physics (Oxford, England). Clarendon Press, Oxford, UK, 1930. x + 257 pp. LCCN QC174.12 .D57 1930. On page 96 of this book, Dirac introduces the notation $\hbar = h/(2\pi)$, where “$\hbar$ is a new universal constant having the dimensions of action.” That symbol is actually a letter in the Serbian alphabet (Unicode character U045B, Cyrillic small letter tshe), but it is unknown to this bibliographer whether Dirac knew that. It seems more likely that he simply added a stroke across $\hbar$ as a convenient indication of its division by 2$\pi$.

Theory and methods. *Mathematical proceedings of the Cambridge Philosophical Society*, 24(1):89–110, ???? 1928. CODEN PCPSA4. ISSN 0008-1981. Page 91 of this paper introduces atomic units for length ($a_H = h^2/(4\pi^2me^2)$, the radius of first Bohr orbit of hydrogen), charge ($e$, the electron charge), and mass ($m$, electron mass). From these are derived the unit of action ($h/(2\pi)$), the unit of energy ($e^2/a$, twice the ionization energy of hydrogen), and the unit of time ($1/(4\pi cR)$). The value $R$ is the Rydberg constant.

[Maj37] Ettore Majorana. Teoria simmetrica dell elettrone e del positrone. (Italian) Symmetrical theory of the electron and the
In this paper, Majorana predicted the existence of a new type of particle, now called a Majorana fermion, which is its own antiparticle, and whose existence may have finally been confirmed by experiment seventy years later [FK08, MZF+12, Ser12]. See also comments in [ACM10]. Esposito [Esp08] reports about this paper “With amazing farsightedness Majorana suggested that the neutrino, which had just been postulated by Wolfgang Pauli and Fermi to explain puzzling features of radioactive beta decay, could be such a particle. This would make the neutrino unique among the elementary particles and, moreover, enable it to have mass. Today many experiments are still devoted to detect these peculiar properties, which include the phenomenon of neutrino oscillations: we have not yet succeeded to find a definite answer to Majorana’s proposal.”.
