LAPACK Working Note 71
IBM RS/6000-550 & -590 Performance for Selected Routines in ESSL*/LAPACK /NAG†/IMSL‡§

Jack Dongarra and Michael Kolatis
Department of Computer Science
University of Tennessee
Knoxville, Tennessee 37996-1301

May 3, 1994

1 Overview

This document contains performance results for selected double-precision real and double-precision complex LAPACK routines and their equivalents in ESSL, NAG, and IMSL. The routines are listed in Figure 1.

2 Timing Environments

The experiments were conducted in two different timing environments: the IBM RS/6000-550 and the IBM RS/6000-590. In both cases the input matrices were identical for similar routines from different packages, thereby eliminating timing discrepancies resulting from pivoting, etc. Also, all timings were performed with no other users logged in to the machine.

2.1 IBM RS/6000 model 550

For the RS/6000 model 550 machine, routines were selected from the following four numerical algebra packages:

ESSL Version 2.2.1

*ESSL is a trademark of IBM.

†NAG is a trademark of The Numerical Algorithms Group Limited.

‡IMSL is a trademark of Visual Numerics, Inc.

§This work supported in part by the Office of Scientific Computing, U.S. Department of Energy, under Contract DE-AC05-84OR21400 and in part by IBM.

Figure 1: **The matched subroutines from each library and a brief description. Similar descriptions list the double-precision real routines before the double-precision complex.**

Description	LAPACK	ESSL	NAG	IMSL
General LU Factorization	DGETRF	DGEF	F07ADF	DLFTRG
General LU Factorization	ZGETRF	ZGEF	F07ARF	DLFTCG
Solve Ax = b Using LU	DGETRS	DGESM	F07AEF	DLFSRG
Solve Ax = b Using LU	ZGETRS	ZGESM	F07ASF	DLFSCG
Cholesky Factorization	DPOTRF	DPOF	F07FDF	DLFTDS
Cholesky Factorization	ZPOTRF	ZPOF	F07FRF	DLFTDH
Solve Ax = b Using Cholesky	DPOTRS	DPOSM	F07FEF	DLFSDS
Solve Ax = b Using Cholesky	ZPOTRS	ZPOSM	F07FSF	DLFSDH
Find Eigenvalues and Eigenvectors	DSPEV	DSLEV[a]	F02ABF	DEVSCF
Find Eigenvalues and Eigenvectors	ZHPEV	ZHLEV[b]	F02AXF	DEVSHF

[a] ESSL 2.2.1 accepts either DSPEV or DSLEV as the subroutine name for this routine; therefore, DSLEV has been used to prevent a name conflict with LAPACK's DSPEV. This is consistent throughout this report.

[b] ESSL 2.2.1 accepts either ZHPEV or ZHLEV as the subroutine name for this routine; therfore, ZHLEV has been used to prevent a name conflict with LAPACK's ZHPEV. This is consistent throughout this report.

LAPACK 1.1

NAG Mark 16

IMSL Version 2.0

All of the timings were made under the following conditions:

- AIX 3.2.5 was the operating system.
- XLF 3.1 was the Fortran compiler.
- *xlf -O2* `filename.f` was the compile command for **all** subroutines.
- *-lessl* was the ESSL library link for this architecture.
- The BLAS for all packages were supplied by the ESSL library. This gave all the packages an equal footing: that is to say, the algorithmic speed of different routines could be measured without an initial handicap of a slower or naive BLAS implementation.
- *READRTC* was the IBM-supplied utility subprogram for obtaining the timing data. It has a resolution of 1 microsecond.
- Blocksize selection routines were not modified for any of the blocking algorithms in any of the packages.

2.2 IBM RS/6000 model 590–256kByte data cache

For the IBM RS/6000 model 590 machine, routines were selected from the following two numerical algebra packages; IMSL and NAG have not yet been made available for the XLF 3.1 compiler on this architecture.

ESSL Version 2.2.1

LAPACK 1.1

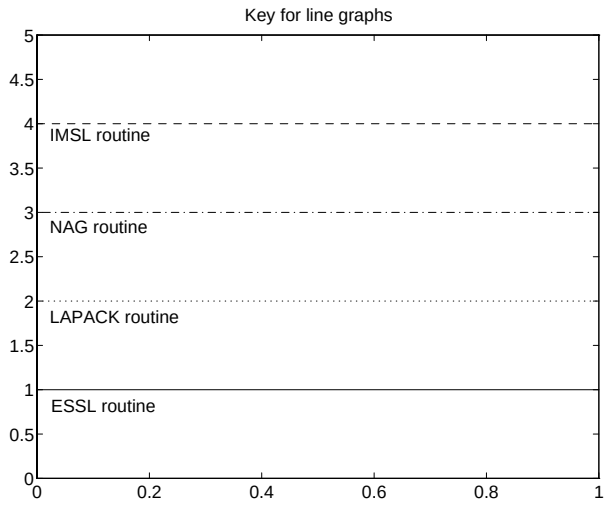
All of the timings were made under the following parameters:

- AIX 3.2.5 was the operating system.
- XLF 3.1 was the Fortran compiler.
- *xlf -O2 -qarch=pwrx* `filename.f` was the compile command for **all** subroutines.
- *-lesslp2* was the ESSL library link for this architecture.
- The BLAS were supplied by the ESSL package. This gave all the packages an equal footing: that is to say, the algorithmic speed of different routines could be measured without an initial handicap of a slower or naive BLAS implementation.
- *READRTC* was the IBM-supplied utility subprogram for obtaining the timing data. It has a resolution of 1 microsecond.
- Blocksize selection routines were not modified for any of the blocking algorithms in any of the packages.

3 Results

In this section, we discuss the computational results for each routine. Also discussed are the tests that were performed to ensure the validity of the timing data, as well as any specifics to the implementation of the subroutine The title of each subsection is the "4-tuple" of equivalent routines from ESSL, LAPACK, NAG, and IMSL, respectively.

All graphs utilize the following key:



Several points should be noted in reading the graphs:

- The data from both machines is graphed together; therefore, six lines appear on every graph (4 from the 550 and 2 from the 590). When two lines of the same type occur (only ESSL or LAPACK), the "faster" line always represents the IBM RS/6000-590. This format allows the comparison of all the numerical packages on the IBM RS/6000-550 as well as the contrast of ESSL and LAPACK on both machines.
- Some lines may overlap. In case of confusion, the timing data should be consulted.

3.1 *DGEF, DGETRF, F07ADF, DLFTRG*

The four routines DGEF, DGETRF, F07ADF, and DLFTRG compute the *LU* factorization of a general square DOUBLE PRECISION matrix. Note that NAG's implementation of F07ADF is LAPACK's DGETRF; consequently, the times are similar. Also, note that DGEF produces the same output format as DGETRF.

The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.2 *ZGEF, ZGETRF, F07ARF, DLFTCG*

The routines ZGEF, ZGETRF, F07ARF, and DLFTCG compute the *LU* factorization of a general square COMPLEX*16 matrix. Note that NAG's implementation of F07ARF is LAPACK's ZGETRF; consequently, the times are similar. Also, note that ZGEF produces the same output format as ZGETRF. The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.3 *DGESM, DGETRS, F07AE , DLFSRG*

The routines DGESM, DGETRS, F07AEF, and DLFSRG perform a DOUBLE PRECISION triangular solve, given a solution matrix and the factorization from Section 3.1. Note that NAG's implementation of F07AEF, ESSL's implementation of DGESM, and LAPACK's implementation of DGETRS are essentially the same; consequently, the times are similar. Also, IMSL's routine does not solve for multiple right-hand sides–rather, just a solution vector. Therefore, the following code was used to make IMSL's routine equivalent to the others:

```
      DO 100 IRHS = 1, NRHS
         CALL DLFSRG(..., B( 1, IRHS ), ...)
100   CONTINUE
```

The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.4 *ZGESM, ZGETRS, F07ASF, DLFSCG*

The routines ZGESM, ZGETRS, F07ASF, and DLFSCG perform a COMPLEX*16 triangular solve, given a solution matrix and the factorization from Section 3.2. Note that NAG's implementation of F07ASF, ESSL's implementation of ZGESM, and LAPACK's implementation of ZGETRS are essentially the same; consequently, the times are similar. Also, IMSL's routine does not solve for multiple right-hand sides–rather, just a solution vector. Therefore, the following code was used to make IMSL's routine equivalent to the others:

```
      DO 100 IRHS = 1, NRHS
         CALL DLFSCG(..., B( 1, IRHS ), ...)
100   CONTINUE
```

The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.5 *DPOF, DPOTRF, F07FDF, DLFTDS*

The routines DPOF, DPOTRF, F07FDF, and DLFTDS compute the Cholesky factorization of a symmetric positive definite DOUBLE PRECISION matrix. Note that NAG's implementation of F07FDF is LAPACK's DPOTRF; consequently, the times are similar. For uniformity, the **upper** triangle is used for all timing data.

The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.6 *ZPOF, ZPOTRF, F07FRF, DLFTDH*

These routines compute the Cholesky factorization of a Hermitian positive definite COMPLEX*16 matrix. Note that NAG's implementation of F07FRF is LAPACK's ZPOTRF; consequently, the times are similar. For uniformity, the **upper** triangle is used for all timing data.

The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.7 *DPOSM, DPOTRS, F07FEF, DLFSDS*

The routines DPOSM, DPOTRS, F07FEF, and DLFSDS perform a DOUBLE PRECISION triangular solve, given a solution matrix and the factorization from Section 3.5. Note that NAG's implementation of F07FEF is LAPACK's DPOTRS; consequently, the times are similar. Also, IMSL's routine does not solve for multiple right-hand sides–rather, just a solution vector. Therefore, the following code was used to make IMSL's routine equivalent to the others:

```
      DO 100 IRHS = 1, NRHS
         CALL DLFSDS(..., B( 1, IRHS ), ...)
100   CONTINUE
```

For uniformity, the **upper** triangle is used for all timing data.

The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.8 *ZPOSM, ZPOTRS, F07FSF, DLFSDH*

The routines ZPOSH, ZOTRS, F07FSF, and DLFSDH do a COMPLEX*16 triangular solve, given a solution matrix and the factorization from Section 3.6. Note that NAG's implementation of F07FSF is LAPACK's ZPOTRS; consequently, the times are similar. Also, IMSL's routine does not solve for multiple right-hand sides–rather, just a solution vector. Therefore, the following code was used to make IMSL's routine equivalent to the others:

```
      DO 100 IRHS = 1, NRHS
         CALL DLFSDH(..., B( 1, IRHS ), ...)
100   CONTINUE
```

For uniformity, the **upper** triangle is used for all timing data.

The following test was run to validate the results:

$$\frac{\|Ax-b\|}{\|A\|\|x\|\epsilon}$$

where ϵ is the machine precision.

3.9 *DSLEV, DSPEV, F02ABF, DEVSCF*

The routines DSLEV, DSPEV, F02ABF, and DEVSCF compute the eigenvalues and eigenvectors of a DOUBLE PRECISION symmetric matrix. Unlike the first 8 routines, NAG's F02ABF is *not* equivalent to LAPACK's DSPEV. Also, LAPACK and ESSL use input matrices in *packed* form, whereas NAG and IMSL do not. For uniformity, the **upper** triangle is used for all timing data.

The following test was run to validate the results:

$$\frac{\|A - ZDZ^T\|}{\|A\| * n * \epsilon} \quad \text{and} \quad \frac{\|I - ZZ^T\|}{n * \epsilon}$$

where A is the symmetric input matrix of order n. Z contains the eigenvectors, and D contains the eigenvalues. I is the identity matrix, and ϵ is the machine precision.

3.10 *ZHLEV, ZHPEV, F02AXF, DEVCHF*

These routines compute the eigenvalues and eigenvectors of a COMPLEX*16 Hermitian matrix. Unlike the first 8 routines, NAG's F02AXF is NOT equivalent to LAPACK's ZHPEV. Also, LAPACK and ESSL use input matrices in *packed* form, whereas, NAG and IMSL do not. Further, NAG accepts its input matrix as two real matrices–one to hold the real values, and the other to hold the imaginary ones. ESSL, LAPACK, and IMSL accept one complex input matrix. For uniformity, the **upper** triangle is used for all timing data.

The following test was run to validate the results:

$$\frac{\|A - ZDZ^T\|}{\|A\| * n * \epsilon} \quad \text{and} \quad \frac{\|I - ZZ^T\|}{n * \epsilon}$$

where A is the symmetric input matrix of order n. Z contains the eigenvectors, and D contains the eigenvalues. I is the identity matrix, and ϵ is the machine precision.

4 Discussion

All of the tested subroutines appear to be numerically correct on both the IBM RS/6000-550 and the new IBM RS/6000-590. Further, the ESSL subroutines achieve the overall best performance of all the packages used. Also, as a side note, the ESSL BLAS have been tested and appear error-free; better yet, they are optimized for both architectures (as most manufacturer's BLAS packages typically are). Consequently, it is recommended that the ESSL BLAS library be linked in front of the numerical analysis package of choice.

A Timing Data

The following tables are output files of the times on the IBM RS/6000-550 and RS/6000-590, respectively. Counts for Megaflops are based upon the number of operations performed in the LAPACK routines.
