

# GridSolve: A Seamless Bridge Between the Standard Programming Interfaces and Remote Resources

---

Jack Dongarra  
University of Tennessee  
and  
Oak Ridge National Laboratory

2/25/2006

1

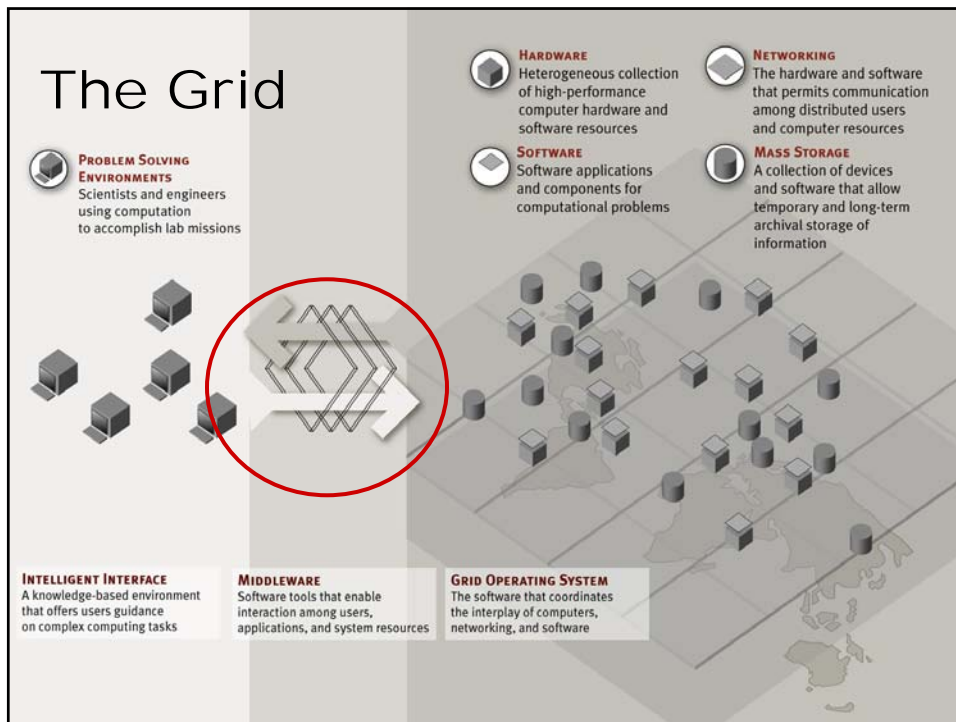

## Overview

---

- ◆ **Grid/NetSolve**
  - **Grid enabled software**
  - **Allows easy access to remote resources**
- ◆ **No magic**
  - **Someone has to write a program**
  - **The program may run on a parallel computer**
- ◆ **NetSolve is a tool for distributed computing**

\$countupmm

2

ICLUT

## What is NetSolve?

- ◆ **Client-server RPC-like system**
  - **Designed for ease-of-use**
- ◆ **Interactions mediated by an agent**
  - **e.g. scheduling, tracking, fault tolerance**
- ◆ **Dynamic service bindings**
  - **Client does not need to have stubs for the services that it wishes to use**
- ◆ **Multiple clients**
  - **C, Fortran, Matlab, Java, Mathematica, Octave**
- ◆ **Extended to support GridRPC API**
  - **Part of GGF working group defining a standard API**

\$countupmm

4

## University of Tennessee's NetSolve Grid Enabled Server

- ◆ NetSolve is an example of a Grid based hardware/software/data server.
- ◆ Based on a Remote Procedure Call model but with ...
  - resource discovery, dynamic problem solving capabilities, load balancing, fault tolerance asynchronicity, security, ...
- ◆ Easy-of-use paramount
- ◆ Its about providing transparent access to resources.
- ◆ Legacy codes easily wrapped into services

## GridSolve Architecture

`[x,y,z,info] = gridsolve('dgesv', A, B)`

Can be from Matlab, C, Fortran, Python, Java, Mathematica, Excel, ...

## NetSolve Client

- ◆ **Function Based Interface.**
- ◆ **Client program embeds call from NetSolve's API to access additional resources.**
- ◆ **Interface available to C, Fortran, Matlab, and Mathematica.**
- ◆ **Opaque networking interactions.**
- ◆ **NetSolve can be invoked using a variety of methods: blocking, non-blocking, task farms, ...**

\$countupmm

7

## NetSolve Client

- ◆ **Intuitive and easy to use.**
- ◆ **Matlab Matrix multiply e.g.:**
  - **$A = \text{matmul}(B, C);$**
  - $A = \text{netsolve}(\text{'matmul'}, B, C);$
- **Possible parallelisms hidden.**

\$countupmm

8

## NetSolve Client

- i. Client makes request to agent.
- ii. Agent returns list of servers.
- iii. Client tries first one to solve problem.

\$countupmm

9

## NetSolve Agent

- ◆ Name server for the NetSolve system.
- ◆ Information Service
  - client users and administrators can query the hardware and software services available.
- ◆ Resource scheduler
  - maintains both static and dynamic information regarding the NetSolve server components to use for the allocation of resources

\$countupmm

10

# NetSolve Agent

- ◆ **Resource Scheduling (cont'd):**
  - CPU Performance.
  - Network bandwidth, latency.
  - Server workload.
  - Problem size/algorithm complexity.
  - Calculates a "Time to Compute." for each appropriate server.
  - Notifies client of most appropriate server.

\$countupmm

11

# Basic Usage Scenarios

- ◆ **Grid based numerical library routines**
  - User doesn't have to have software library on their machine, LAPACK, SuperLU, ScaLAPACK, PETSc, ARPACK, ...
- ◆ **Task farming applications**
  - "Pleasantly parallel" execution eg Parameter studies
  - Scavenge cycles
- ◆ **Remote application execution**
  - Complete applications with user specifying input parameters and receiving output
- ◆ **"Blue Collar" Grid Based Computing**
  - Does not require deep knowledge of network programming
  - Level of expressiveness right for many users
  - User can set things up, no "su" required
  - In use today, up to 130 servers on the experimental grid
- ◆ **Can plug into Globus, Condor, NINF, ...**

\$countupmm

12

## Task Farming - Multiple Requests To Single Problem

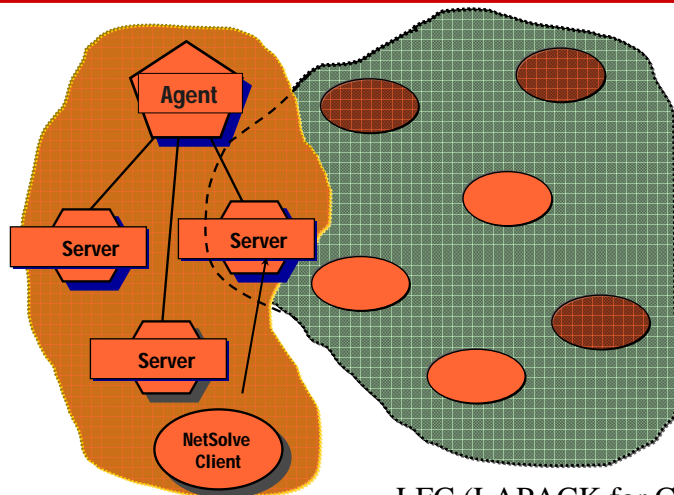

- ◆ **A Solution:**
  - Many calls to `netslnb( )`; /\* non-blocking \*/
- ◆ **Farming Solution:**
  - Single call to `netsolve_farm( )`;
- ◆ Request iterates over an "array of input parameters."
- ◆ Adaptive scheduling algorithm.
- ◆ Useful for parameter sweeping, and independently parallel applications.

\$countupmm

13

## Server Proxies – Hide Parallelism

NetSolve System

LFC (LAPACK for Clusters),  
Condor, ScaLAPACK, etc.

\$countupmm

User maybe unaware of parallel processing

14

# GridSolve Usage with VGrADS

- ◆ Simple-to-use access to complicated software libraries, with no knowledge of grid based computing.
- ◆ Selection of best machines in your grid to service user request
- ◆ Portability
  - Non-portable calls can be run from a client using RPC like mechanisms as long there is a server provisioned with the code
- ◆ Legacy codes easily wrapped into services

- ◆ Plug into VGrADS Framework
- ◆ Using the vgES for resource selection and launching of application:
  - Integrated performance information
  - Integrated monitoring
  - Fault prediction
  - Integrating the software and resource information repositories

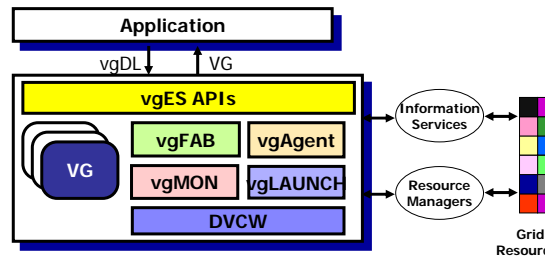

\$countupm

15

# Virtual Grid Execution System (vgES)

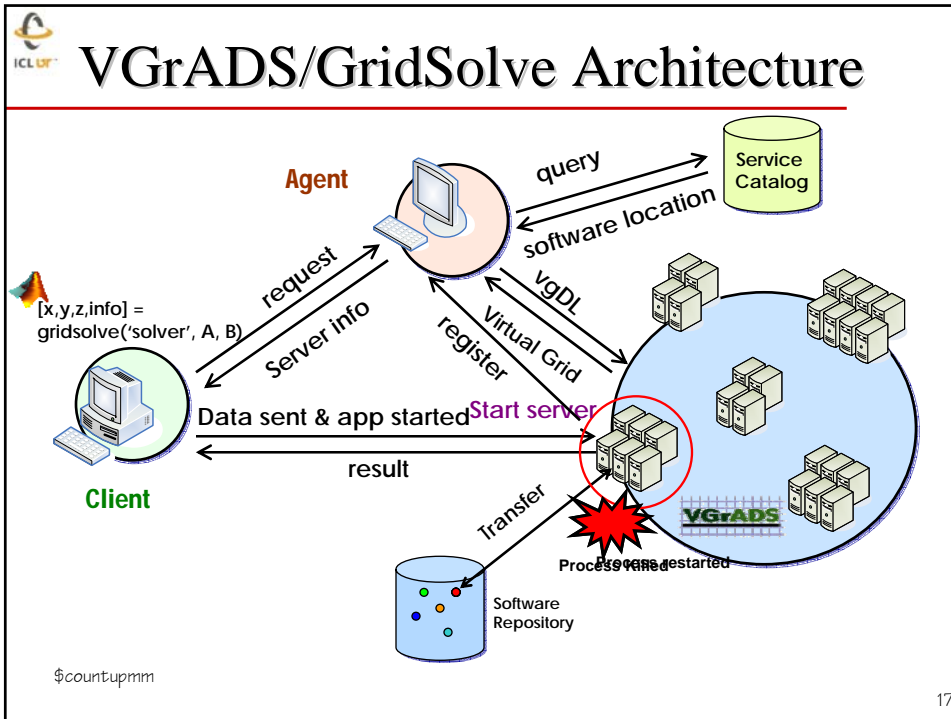

- ◆ A Virtual Grid (VG) takes
  - Shared heterogeneous resources
  - Scalable information service
- ◆ and provides
  - An hierarchy of application-defined aggregations (e.g. ClusterOf) with constraints (e.g. processor type) and rankings
- ◆ Virtual Grid Execution System (vgES) implements VG
  - VG Definition Language (vgDL)
  - VG Find And Bind (vgFAB)
  - VG Monitor (vgMON)
  - VG Application Launch (vgLAUNCH+DVCW)
  - VG Resource Info (vgAgent)

\$countupm

Grid 16 Resources

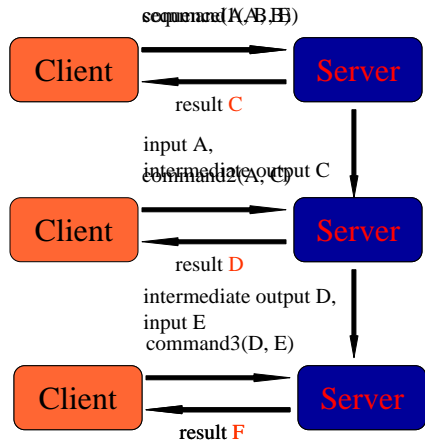

- ## Data Persistence
- ◆ Chain together a sequence of NetSolve requests.
  - ◆ Analyze parameters to determine data dependencies. Essentially a DAG is created where nodes represent computational modules and arcs represent data flow.
  - ◆ Transmit superset of all input/output parameters and make **persistent** near server(s) for duration of sequence execution.
  - ◆ Schedule individual request modules for **execution**.
- \$countupmm
- 18

# Data Persistence (cont'd)

```

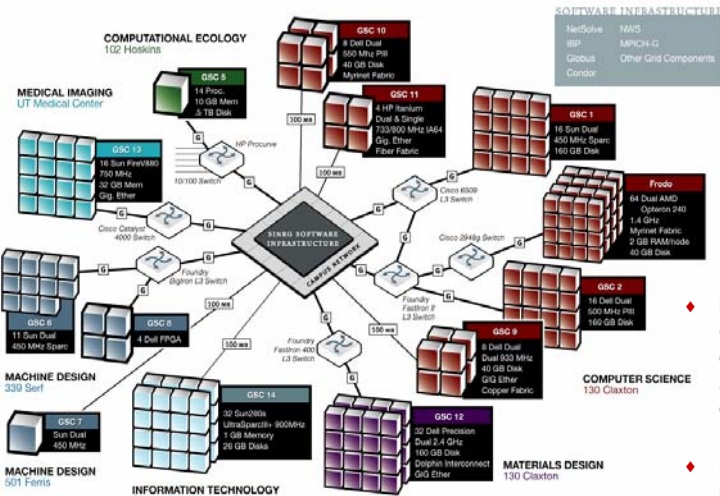

netsl_begin_sequence();
netsl("command1", A, B, C);
netsl("command2", A, C, D);
netsl("command3", D, E, F);
netsl_end_sequence(C, D);

```

\$countupmm

# Current SInRG Infrastructure

- ◆ **Federated Ownership:** CS, Chem Eng., Medical School, Computational Ecology, EI. Eng.
- ◆ **Real applications:** middleware development, logistical networking

**Industry Partners:**  
 Microsoft, Sun, Dell, Cisco,  
 Foundry, Dolphin, Myracom

\$countupmm

# NetSolve- Things Not Touched On

- ◆ **Integration with other NMI tools**
  - Globus, Condor, Network Weather Service
- ◆ **Security**
  - Using Kerberos V5 for authentication.
- ◆ **Monitor NetSolve Network**
  - Track and monitor usage
- ◆ **Fault Tolerance**
- ◆ **Local / Global Configurations**
- ◆ **Dynamic Nature of Servers**
- ◆ **Automated Adaptive Algorithm Selection**
  - Dynamic determine the best algorithm based on system status and nature of user problem
- ◆ **NetSolve evolving into GridRPC**
  - Being worked on under GGF with joint with NINF

\$countupmm
